

Door Straightener, Adjustable – Semi Recessed – 2500mm

Variant code: ADS07250

Hidden door straighteners are needed to avoid bending on both sliding and swinging doors. Sliding doors tend to bend in the first upper third, and hinged doors bend in the centre section.

All adjustments are done from either the top or bottom of the door via a hex drive (not included).

This product is cuttable, this means that the bar can be trimmed up to 400mm from the original length. The strength of the door adjuster is always indicated on the side of the data sheet but it depends on the thickness and the material of the door.

A trail application is always recommended.

This is a raw aluminium product, and doesn't come with fixings.
