PLASTER-IN Light Profile - Raw Aluminium - 2000mm

Variant code: LLP20000RA.2000

LED strips can be installed in building materials such as plasterboard. This gives great possibilities in the design and arrangement of space.

Such boards can be easily cut to size, the preferred thickness can be selected, and thanks to their low weight their installation is not difficult. As a result, they can be used in a wide range of applications and, in addition, some of our profiles will fit into panels of standard thickness without the need for milling the substrate or a plasterboard frame.

It is also possible to create a continuous line of light using 120 P/m strip, which will further emphasise the designer character of the interior.
